

Class 10th rise observation;

- 1) Yellow button added but still correction that whether these notifications should be vertical or horizontal that should be done is still pending.
- 2) And updates or red blinking button and it but still there is one more thing which we need is the red blinking should be controlled by the admin whenever he wants.
- 3) And whenever any circular is needed to remove them should be an option while removing that it should ask that weather should be removed from the home screen yellow this thing or it should be removed from the updates corner like there should be multiple options for that removal also.
- 4) Date and timing update should also be a control button should be added in the admin HTML file.
- 5) And one more thing which we needed was the login I like whenever any person visit to sites and is using this soul file it should also should we there should be a sign up first and then whenever he wants to login he can login through this is file so that one option should be added and yes you notification button is like due to which I guess it's not working properly like there is no login this thing if we bring up login properly it will we can also apply the notification which we have in the admin so just one thing.
- 6) Nothing here which I will add here is that whenever any files are anything is uploaded its timing date should be mention a date is already mention in the resting but we also have to mention the time at which it is uploaded and if you want to remove any files there should be option to remove it and if you want to edit the file there should be also an option for it in the admin folder.
